Original product title: 激光自准直仪

Product overview

This autocollimator uses a laser light source. Its compact design and wide field of view support angle measurement and parallelism measurement of multiple light spots. Standard products use a 650nm semiconductor laser and support both internal and external light-source modes.

Applications

Applications include angular measurement and parallelism measurement of laser spots. The source describes central accuracy down to ±0.5″ and a standard field of view of 1~3° across the range. The compact modular instrument can be used independently or mounted on a stand. The light source has an independent switch, and internal/external light-source measurement modes can be selected. Individual model specifications apply.

Technical specifications

Parameter	Source data
Objective focal length	100mm
Objective aperture	25mm

Parameter	Source data
Clear aperture	20mm
Light source type	650nm Semiconductor laser
Spot diameter	2mm
Field of view (X, Y)	6600*5400″ (within 200mm)
Indication error	±1000″≤ ±2″ ; Full range≤ ±5″
Detector type	High-precision area-array detector
Display and control	Software control on WINDOWS
Overall dimensions	195*52*58mm
Notes	Hardware or software can be customized to user requirements

Use and verification notes

Compiled from the saved official source. Resolution is not accuracy. Preserve the stated range, environment and configuration conditions. Selection and acceptance are subject to the technical specification agreed by both parties.
